ABSTRACT

Let  $C$  be a non-perfect square positive-integer and  $C = m^2 \pm 4$ . The basic solution of the Pell equation is found in the present article  $x^2 - Cy^2 = \pm 1$  by using Continued fraction expansion of  $\sqrt{C}$ . Also, in terms of Generalized Bi-Periodic Fibonacci & Lucas sequences, we obtain all positive-integer solutions of the Pell equation  $x^2 - Cy^2 = \pm 1$ .

**Keywords:** Continued fraction, Pell equations, Generalized Bi-Periodic Fibonacci and Lucas sequences.

**2010 Mathematics Subject Classifications:** 11A55, 11B39, 11D55, 11D09, 11J70.

1 Introduction

It is generally recognized that the Pell equation  $x^2 - Cy^2 = 1$  always have positive-integer solutions, where  $C$  is a positive integer which is not a perfect square. When  $N$  is not equal to 1, there may be no positive-integer solution for  $x^2 - Cy^2 = N$  Pell equation. The positive-integer solution for  $x^2 - Cy^2 = -1$  equation depends on the period length of  $\sqrt{C}$  continued fraction expansion. In [10],

we gave all positive-integer solutions of the Pell equation  $x^2 - Cy^2 = \pm 1$  in terms of Generalized Bi-Periodic Fibonacci and Lucas sequences for the choices  $C = m^2 \pm 1, m^2 \pm 2, m^2 \pm m$ . In the present article, when  $m$  is a positive integer as well as  $C = m^2 \pm 4$ , particularly if a solution is available, all positive integer solutions are provided in terms of Generalized Bi-Periodic Fibonacci and Lucas sequences by utilizing  $\sqrt{C}$  continued fraction expansion.

## 2 Preliminaries

Some writers have generalized the sequences, Fibonacci & Lucas, by altering their initial conditions and recurring relations. Yayenie & Edson ([4]) generalize the Fibonacci sequence to the new set of sequences denoted as  $\{p_n\}$  and is defined by

$$p_0 = 0, p_1 = 1, p_n = \begin{cases} ap_{n-1} + p_{n-2}, & \text{if } n \text{ is even} \\ bp_{n-1} + p_{n-2}, & \text{if } n \text{ is odd} \end{cases} \quad (n \geq 2).$$

Bilgici ([6]), on contrary, generalized the Lucas sequence by presenting a bi-periodic Lucas sequence denoted as  $\{l_n\}$  and is expressed as:

$$l_0 = 2, l_1 = a, l_n = \begin{cases} bl_{n-1} + l_{n-2}, & \text{if } n \text{ is even} \\ al_{n-1} + l_{n-2}, & \text{if } n \text{ is odd} \end{cases} \quad (n \geq 2).$$

as well as several interesting associations between  $\{p_n\}$  &  $\{l_n\}$  have been proven.

We now consider a generalized bi-periodic Fibonacci sequence  $\{f_n\}$  and Lucas sequence  $\{q_n\}$  which are the generalization of  $\{p_n\}$  and  $\{l_n\}$ , termed as:

$$f_0 = 0, f_1 = 1, f_n = \begin{cases} af_{n-1} + cf_{n-2}, & \text{if } n \text{ is even} \\ bf_{n-1} + cf_{n-2}, & \text{if } n \text{ is odd} \end{cases} \quad (n \geq 2),$$

and

$$q_0 = 2d, q_1 = ad, q_n = \begin{cases} bq_{n-1} + cq_{n-2}, & \text{if } n \text{ is even} \\ aq_{n-1} + cq_{n-2}, & \text{if } n \text{ is odd} \end{cases} \quad (n \geq 2),$$

where  $a, b, c, d$  are nonzero real numbers.

Yayenie and Choo ([4] and [5]) gave Binet's formulas for  $\{f_n\}$  &  $\{q_n\}$  are represented as:

$$f_n(a, b, c) = \frac{a^{\zeta(n+1)}}{(ab)^{\lfloor \frac{n}{2} \rfloor}} \left( \frac{\alpha^n - \beta^n}{\alpha - \beta} \right) \quad (1)$$

$$q_n(a, b, c, d) = \frac{d}{(ab)^{\lfloor \frac{n}{2} \rfloor} b^{\zeta(n)}} (\alpha^n + \beta^n) \quad (2)$$

where  $\alpha = \frac{ab + \sqrt{a^2b^2 + 4abc}}{2}$  and  $\beta = \frac{ab - \sqrt{a^2b^2 + 4abc}}{2}$ , i.e.,  $\alpha$  and  $\beta$  are the roots of the equation  $x^2 - abx - abc = 0$ , and  $\zeta(n) = n - 2 \lfloor \frac{n}{2} \rfloor$  is the parity function such that

$$\zeta(n) = \begin{cases} 0 & \text{if } n \text{ is even} \\ 1 & \text{if } n \text{ is odd} \end{cases}$$

We now provide the fundamental solution to an equation  $x^2 - Cy^2 = \pm 1$  utilizing the length of a period of  $\sqrt{C}$  continued fraction expansion.

**Lemma 2.1:** Suppose  $l$  be the period length of  $\sqrt{C}$  continued fraction expansion. When  $l$  is even, then the fundamental solution for  $x^2 - Cy^2 = 1$  equation is represented as:

$$x_1 + y_1\sqrt{C} = p_{l-1} + q_{l-1}\sqrt{C}$$

and  $x^2 - Cy^2 = -1$  equation has no integer solution. In case of  $l$  is odd, then the fundamental solution for  $x^2 - Cy^2 = 1$  equation is represented as:

$$x_1 + y_1\sqrt{C} = p_{2l-1} + q_{2l-1}\sqrt{C}$$

and fundamental solution for  $x^2 - Cy^2 = -1$  equation is represented as:

$$x_1 + y_1\sqrt{C} = p_{l-1} + q_{l-1}\sqrt{C}$$

**Cognition 2.1** Let  $x_1 + y_1\sqrt{C}$  be the fundamental solution of  $x^2 - Cy^2 = 1$  equation. Then all positive-integer solutions of  $x^2 - Cy^2 = 1$  equation is represented as:

$$x_n + y_n\sqrt{C} = (x_1 + y_1\sqrt{C})^n$$

with  $n \geq 1$ .

**Cognition 2.2** Let  $x_1 + y_1\sqrt{C}$  be the fundamental solution of  $x^2 - Cy^2 = -1$ . Then all positive-integer solutions for  $x^2 - Cy^2 = -1$  are represented as:

$$x_n + y_n\sqrt{C} = (x_1 + y_1\sqrt{C})^{2n-1}$$

with  $n \geq 1$ .

**Cognition 2.3** Let  $C = m^2 \pm 4$ . Then  $\sqrt{C}$  continued fraction expansion is given by

$$\sqrt{C} = \begin{cases} \left[ m; \overline{\frac{m}{2}, 2m} \right] & \text{if } C = m^2 + 4 \text{ and } m \text{ is even with } m \geq 1 \\ \left[ m; \overline{\frac{m-1}{2}, 1, 1, \frac{m-1}{2}, 2m} \right] & \text{if } C = m^2 + 4 \text{ and } m \text{ is odd with } m \geq 1 \\ \left[ m-1; \overline{1, \frac{m-3}{2}, 2, \frac{m-3}{2}, 1, 2(m-1)} \right] & \text{if } C = m^2 - 4 \text{ and } m \text{ is odd with } m \geq 3 \\ \left[ m-1; \overline{1, \frac{m-4}{2}, 1, 2(m-1)} \right] & \text{if } C = m^2 - 4 \text{ and } m \text{ is even with } m > 2, m \neq 4 \\ [3; \overline{2, 6}] & \text{if } m = 4 \end{cases}$$

**Corollary 2.1** Let  $C = m^2 \pm 4$ . The basic solution of  $x^2 - Cy^2 = 1$  equation is represented as:

$$x_1 + y_1\sqrt{C} = \begin{cases} \frac{m^6 + 6m^4 + 9m^2 + 2}{2} + \frac{m^5 + 4m^3 + 3m}{2}\sqrt{C} & \text{if } C = m^2 + 4 \text{ and } m \text{ is odd} \\ \frac{m^2 + 2}{2} + \frac{m}{2}\sqrt{C} & \text{if } C = m^2 + 4 \text{ and } m \text{ is even} \\ \frac{m^3 - 3m}{2} + \frac{m^2 - 1}{2}\sqrt{C} & \text{if } C = m^2 - 4 \text{ and } m \text{ is odd} \\ \frac{m^2 - 2}{2} + \frac{m}{2}\sqrt{C} & \text{if } C = m^2 - 4 \text{ and } m \text{ is even} \end{cases}$$

**Corollary 2.2** Let  $m > 0$  and  $C = m^2 \pm 4$ . The basic solution of  $x^2 - Cy^2 = -1$  is

$$x_1 + y_1\sqrt{C} = \begin{cases} \frac{m^3 + 3m}{2} + \frac{m^2 + 1}{2}\sqrt{C} & \text{if } C = m^2 + 4 \text{ and } m \text{ is odd} \\ \text{nosolution} & \text{if } C = m^2 + 4 \text{ and } m \text{ is even} \\ \text{nosolution} & \text{if } C = m^2 - 4 \text{ and } m > 3 \end{cases}$$

**3 Main Theorems**

**Theorem 3.1** Let  $m > 1$  and  $C = m^2 + 4$ . Then all positive-integer solutions of the equation  $x^2 - Cy^2 = 1$  are given by

$$(x_n, y_n) = \begin{cases} \left\{ \begin{array}{l} \frac{1}{2} m^{\lfloor 3n \rfloor} \left( q_{6n} \left( m, 1, \frac{1}{m}, 1 \right), \frac{1}{m} f_{6n} \left( m, 1, \frac{1}{m} \right) \right) \\ \text{or} \\ \frac{1}{2} m^{\lfloor 3n \rfloor} \left( q_{6n} \left( 1, m, \frac{1}{m}, 1 \right), f_{6n} \left( 1, m, \frac{1}{m} \right) \right) \end{array} \right. & \text{if } m \text{ is odd} \\ \left\{ \begin{array}{l} \frac{1}{2} m^{\lfloor n \rfloor} \left( q_{2n} \left( m, 1, \frac{1}{m}, 1 \right), \frac{1}{m} f_{2n} \left( m, 1, \frac{1}{m} \right) \right) \\ \text{or} \\ \frac{1}{2} m^{\lfloor n \rfloor} \left( q_{2n} \left( 1, m, \frac{1}{m}, 1 \right), f_{2n} \left( 1, m, \frac{1}{m} \right) \right) \end{array} \right. & \text{if } m \text{ is even} \end{cases}$$

with  $n \geq 1$ .

**Proof**

**Case I**

Let  $m$  is odd.

By Corollary 2.1, Cognition 2.1, and Cognition 2.3, all positive integer solutions of the equation  $x^2 - Cy^2 = 1$  are given by

$$x_n + y_n \sqrt{C} = \left( \frac{m^6 + 6m^4 + 9m^2 + 2}{2} + \frac{m^5 + 4m^3 + 3m}{2} \sqrt{C} \right)^n$$

with  $n \geq 1$ . Let  $\alpha_1 = \frac{(m^3+3m)^2+2}{2} + \frac{m((m^2+2)^2-1)}{2} \sqrt{C}$  and  $\beta_1 = \frac{(m^3+3m)^2+2}{2} - \frac{m((m^2+2)^2-1)}{2} \sqrt{C}$ .

Then,

$$x_n + y_n \sqrt{C} = \alpha_1^n \text{ and } x_n - y_n \sqrt{C} = \beta_1^n$$

Thus, it follows that

$$x_n = \frac{\alpha_1^n + \beta_1^n}{2} \text{ and } y_n = \frac{\alpha_1^n - \beta_1^n}{2\sqrt{C}}$$

Let

$$\alpha = \frac{ab + \sqrt{a^2b^2 + 4abc}}{2} \text{ and } \beta = \frac{ab - \sqrt{a^2b^2 + 4abc}}{2}$$

Sub Case (i)

Take  $a = m, b = 1, c = \frac{1}{m}$ , we get

$$\alpha = \frac{m + \sqrt{m^2 + 4}}{2} \text{ and } \beta = \frac{m - \sqrt{m^2 + 4}}{2}$$

Thus,  $\alpha^6 = \alpha_1$  and  $\beta^6 = \beta_1$

Therefore, we get,

$$x_n = \frac{(\alpha^6)^n + (\beta^6)^n}{2} = 2^{-1}(\alpha^{6n} + \beta^{6n}) = 2^{-1}m^{\lfloor 3n \rfloor} q_{6n} \left( m, 1, \frac{1}{m}, 1 \right) \quad \text{by (2)}$$

and

$$y_n = \frac{(\alpha^6)^n - (\beta^6)^n}{2\sqrt{m^2 + 4}} = 2^{-1} \frac{\alpha^{6n} - \beta^{6n}}{\alpha - \beta} = 2^{-1} \frac{m^{\lfloor 3n \rfloor}}{m} f_{6n} \left( m, 1, \frac{1}{m} \right) \quad \text{by (1)}$$

Thus,

$$(x_n, y_n) = \left( \frac{1}{2} m^{\lfloor 3n \rfloor} q_{6n} \left( m, 1, \frac{1}{m}, 1 \right), \frac{1}{2m} m^{\lfloor 3n \rfloor} f_{6n} \left( m, 1, \frac{1}{m} \right) \right)$$

Sub Case (ii)

Take,  $a = 1, b = m, c = \frac{1}{m}$ , we get

$$\alpha = \frac{m + \sqrt{m^2 + 4}}{2} \quad \text{and} \quad \beta = \frac{m - \sqrt{m^2 + 4}}{2}$$

Thus,  $\alpha^6 = \alpha_1$  and  $\beta^6 = \beta_1$

Therefore, we get,

$$x_n = \frac{(\alpha^6)^n + (\beta^6)^n}{2} = 2^{-1}(\alpha^{6n} + \beta^{6n}) = 2^{-1}m^{\lfloor 3n \rfloor} q_{6n} \left( 1, m, \frac{1}{m}, 1 \right) \quad \text{by (2)}$$

and

$$y_n = \frac{(\alpha^6)^n - (\beta^6)^n}{2\sqrt{m^2 + 1}} = 2^{-1} \frac{\alpha^{6n} - \beta^{6n}}{\alpha - \beta} = 2^{-1} m^{\lfloor 3n \rfloor} f_{6n} \left( 1, m, \frac{1}{m} \right) \quad \text{by (1)}$$

Thus,

$$(x_n, y_n) = \left( \frac{1}{2} m^{\lfloor 3n \rfloor} q_{6n} \left( 1, m, \frac{1}{m}, 1 \right), \frac{1}{2} m^{\lfloor 3n \rfloor} f_{6n} \left( 1, m, \frac{1}{m} \right) \right)$$

## Case II

Let  $m$  is even.

By Corollary 2.1, Cognition 2.1, and Cognition 2.3, all positive integer solutions of the equation  $x^2 - Cy^2 = 1$  are given by

$$x_n + y_n \sqrt{C} = \left( \frac{m^2 + 2}{2} + \frac{m}{2} \sqrt{C} \right)^n$$

with  $n \geq 1$ . Let  $\alpha_1 = \frac{m^2 + 2}{2} + \frac{m}{2} \sqrt{C}$  and  $\beta_1 = \frac{m^2 + 2}{2} - \frac{m}{2} \sqrt{C}$ .

Then,

$$x_n + y_n \sqrt{C} = \alpha_1^n \quad \text{and} \quad x_n - y_n \sqrt{C} = \beta_1^n$$

Thus, it follows that

$$x_n = \frac{\alpha_1^n + \beta_1^n}{2} \quad \text{and} \quad y_n = \frac{\alpha_1^n - \beta_1^n}{2\sqrt{C}}$$

Let

$$\alpha = \frac{ab + \sqrt{a^2b^2 + 4abc}}{2} \text{ and } \beta = \frac{ab - \sqrt{a^2b^2 + 4abc}}{2}$$

Sub Case (iii)

Take  $a = m, b = 1, c = \frac{1}{m}$ , we get

$$\alpha = \frac{m + \sqrt{m^2 + 4}}{2} \text{ and } \beta = \frac{m - \sqrt{m^2 + 4}}{2}$$

Thus,  $\alpha^2 = \alpha_1$  and  $\beta^2 = \beta_1$

Therefore, we get,

$$x_n = \frac{(\alpha^2)^n + (\beta^2)^n}{2} = 2^{-1}(\alpha^{2n} + \beta^{2n}) = 2^{-1}m^{[n]}q_{2n}\left(m, 1, \frac{1}{m}, 1\right) \text{ by (2)}$$

and

$$y_n = \frac{(\alpha^2)^n - (\beta^2)^n}{2\sqrt{m^2 + 4}} = 2^{-1}\frac{\alpha^{2n} - \beta^{2n}}{\alpha - \beta} = 2^{-1}\frac{m^{[n]}}{m}f_{2n}\left(m, 1, \frac{1}{m}\right) \text{ by (1)}$$

Thus,

$$(x_n, y_n) = \left(\frac{1}{2}m^{[n]}q_{2n}\left(m, 1, \frac{1}{m}, 1\right), \frac{1}{2m}m^{[n]}f_{2n}\left(m, 1, \frac{1}{m}\right)\right)$$

Sub Case (iv)

Take,  $a = 1, b = m, c = \frac{1}{m}$ , we get

$$\alpha = \frac{m + \sqrt{m^2 + 4}}{2} \text{ and } \beta = \frac{m - \sqrt{m^2 + 4}}{2}$$

Thus,  $\alpha^2 = \alpha_1$  and  $\beta^2 = \beta_1$

Therefore, we get,

$$x_n = \frac{(\alpha^2)^n + (\beta^2)^n}{2} = 2^{-1}(\alpha^{2n} + \beta^{2n}) = 2^{-1}m^{[n]}q_{2n}\left(1, m, \frac{1}{m}, 1\right) \text{ by (2)}$$

and

$$y_n = \frac{(\alpha^2)^n - (\beta^2)^n}{2\sqrt{m^2 + 4}} = 2^{-1}\frac{\alpha^{2n} - \beta^{2n}}{\alpha - \beta} = 2^{-1}\frac{m^{[n]}}{m}f_{2n}\left(1, m, \frac{1}{m}\right) \text{ by (1)}$$

Thus,

$$(x_n, y_n) = \left(\frac{1}{2}m^{[n]}q_{2n}\left(1, m, \frac{1}{m}, 1\right), \frac{1}{2}m^{[n]}f_{2n}\left(1, m, \frac{1}{m}\right)\right)$$

From Cases (I) and (II) we get the required solution.

**Theorem 3.2** Let  $m > 1$  and  $C = m^2 + 4$ . Then all positive solutions of the equation

$x^2 - Cy^2 = -1$  are given by

(i) If  $m$  is odd, then

$$(x_n, y_n) = \begin{cases} \frac{1}{2}m^{\lfloor \frac{6n-3}{2} \rfloor} \left( q_{6n-3} \left( m, 1, \frac{1}{m}, 1 \right), f_{6n-3} \left( m, 1, \frac{1}{m}, 1 \right) \right) \\ \text{or} \\ \frac{1}{2}m^{\lfloor \frac{6n-3}{2} \rfloor} \left( q_{6n-3} \left( 1, m, \frac{1}{m}, 1 \right), f_{6n-3} \left( 1, m, \frac{1}{m}, 1 \right) \right) \end{cases}$$

with  $n \geq 1$ .

(ii) If  $m$  is even, then there is no solution

**Proof**

**Case I**

Let  $m$  is odd.

By Corollary 2.1, Cognition 2.2, and Cognition 2.3, all positive integer solutions of the equation  $x^2 - Cy^2 = -1$  are given by

$$x_n + y_n\sqrt{C} = \left( \frac{m^3 + 3m}{2} + \frac{m^2 + 1}{2}\sqrt{C} \right)^{2n-1}$$

with  $n \geq 1$ . Let  $\alpha_1 = \frac{m^3+3m}{2} + \frac{m^2+1}{2}\sqrt{C}$  and  $\beta_1 = \frac{m^3+3m}{2} - \frac{m^2+1}{2}\sqrt{C}$ .

Then,

$$x_n + y_n\sqrt{C} = \alpha_1^{2n-1} \text{ and } x_n - y_n\sqrt{C} = \beta_1^{2n-1}$$

Thus, it follows that

$$x_n = \frac{\alpha_1^{2n-1} + \beta_1^{2n-1}}{2} \text{ and } y_n = \frac{\alpha_1^{2n-1} - \beta_1^{2n-1}}{2\sqrt{C}}$$

Let

$$\alpha = \frac{ab + \sqrt{a^2b^2 + 4abc}}{2} \text{ and } \beta = \frac{ab - \sqrt{a^2b^2 + 4abc}}{2}$$

Sub Case (i)

Take  $a = m, b = 1, c = \frac{1}{m}$ , we get

$$\alpha = \frac{m + \sqrt{m^2 + 4}}{2} \text{ and } \beta = \frac{m - \sqrt{m^2 + 4}}{2}$$

Thus,  $\alpha^3 = \alpha_1$  and  $\beta^3 = \beta_1$

Therefore, we get,

$$x_n = \frac{(\alpha^3)^{2n-1} + (\beta^3)^{2n-1}}{2} = 2^{-1}(\alpha^{6n-3} + \beta^{6n-3}) = 2^{-1}m^{\lfloor \frac{6n-3}{2} \rfloor} q_{6n-3} \left( m, 1, \frac{1}{m}, 1 \right) \text{ by (2)}$$

and

$$y_n = \frac{(\alpha^3)^{2n-1} - (\beta^3)^{2n-1}}{2\sqrt{m^2 + 4}} = 2^{-1} \frac{\alpha^{6n-3} - \beta^{6n-3}}{\alpha - \beta} = 2^{-1}m^{\lfloor \frac{6n-3}{2} \rfloor} f_{6n-3} \left( m, 1, \frac{1}{m} \right) \text{ by (1)}$$

Thus,

$$(x_n, y_n) = \left( \frac{1}{2}m^{\lfloor n \rfloor} m^{\lfloor \frac{6n-3}{2} \rfloor} q_{6n-3} \left( 1, m, \frac{1}{m}, 1 \right), \frac{1}{2}m^{\lfloor \frac{6n-3}{2} \rfloor} f_{6n-3} \left( m, 1, \frac{1}{m} \right) \right)$$

Sub Case (ii)

Take,  $a = 1, b = m, c = \frac{1}{m}$ , we get

$$\alpha = \frac{m + \sqrt{m^2 + 4}}{2} \text{ and } \beta = \frac{m - \sqrt{m^2 + 4}}{2}$$

Thus,  $\alpha^3 = \alpha_1$  and  $\beta^3 = \beta_1$

Therefore, we get,

$$x_n = \frac{(\alpha^3)^{2n-1} + (\beta^3)^{2n-1}}{2} = 2^{-1}(\alpha^{6n-3} + \beta^{6n-3}) = 2^{-1}m^{\lfloor \frac{6n-3}{2} \rfloor} q_{6n-3} \left(1, m, \frac{1}{m}, 1\right) \text{ by (2)}$$

and

$$y_n = \frac{(\alpha^3)^{2n-1} - (\beta^3)^{2n-1}}{2\sqrt{m^2 + 4}} = 2^{-1} \frac{\alpha^{6n-3} - \beta^{6n-3}}{\alpha - \beta} = 2^{-1}m^{\lfloor \frac{6n-3}{2} \rfloor} f_{6n-3} \left(1, m, \frac{1}{m}\right) \text{ by (1)}$$

Thus,

$$(x_n, y_n) = \left(\frac{1}{2}m^{\lfloor 3n \rfloor} m^{\lfloor \frac{6n-3}{2} \rfloor} q_{6n-3} \left(1, m, \frac{1}{m}, 1\right), \frac{1}{2}m^{\lfloor \frac{6n-3}{2} \rfloor} f_{6n-3} \left(1, m, \frac{1}{m}\right)\right)$$

**Case II**

Let  $m$  is even.

Since by Cognition 2.3, the period length of continued fraction expansion of  $\sqrt{C}$  is always even. Thus, by Lemma 2.1, it follows that there is no positive integer solution of the equation

$$x^2 - Cy^2 = -1.$$

From Cases (I) and (II) we get the required solution.

Now, we consider the other cases of  $C$  without giving their proof since they can be proved as similar to that of Theorem 3.1 and Theorem 3.2 was proved.

**Theorem 3.3** Let  $m > 0$  and  $C = m^2 - 4$ . Then all positive solutions of the equation

$$x^2 - Cy^2 = 1 \text{ are given by}$$

(i) If  $m$  is even, then

$$(x_n, y_n) = \begin{cases} \frac{1}{2}m^{\lfloor n \rfloor} \left( q_{2n} \left( m, 1, \frac{-1}{m}, 1 \right), f_{2n} \left( m, 1, \frac{-1}{m} \right) \right) \\ \text{or} \\ \frac{1}{2}m^{\lfloor n \rfloor} \left( q_{2n} \left( 1, m, \frac{-1}{m}, 1 \right), f_{2n} \left( 1, m, \frac{-1}{m} \right) \right) \end{cases}$$

(ii) If  $m$  is odd, then

$$(x_n, y_n) = \begin{cases} \frac{1}{2}m^{\lfloor \frac{3n}{2} \rfloor} \left( q_{3n} \left( m, 1, \frac{-1}{m}, 1 \right), \frac{1}{m^{\zeta(3n+1)}} f_{3n} \left( m, 1, \frac{-1}{m} \right) \right) \\ \text{or} \\ \frac{1}{2}m^{\lfloor \frac{3n}{2} \rfloor} \left( m^{\zeta(3n)} q_{2n} \left( 1, m, \frac{-1}{m}, 1 \right), f_{3n} \left( 1, m, \frac{-1}{m} \right) \right) \end{cases}$$

with  $n \geq 1$ .

**Theorem 3.8** Let  $C = m^2 - 4$  then the equation  $x^2 - Cy^2 = -1$  has no solution in positive integers.

#### Proof

Since by Cognition 2.3, the period length of continued fraction expansion of  $\sqrt{C}$  is always even. Thus by Lemma 2.1, it follows that there is no positive integer solution of the equation

$$x^2 - Cy^2 = -1.$$

#### 4 Conclusion

In this paper, we investigate the Pell equation  $x^2 - Cy^2 = \pm 1$ ,  $C = m^2 \pm 4$  and we are seeking positive integer solutions in  $x$  and  $y$ . We get all positive integer solutions of the Pell equations  $x^2 - Cy^2 = \pm 1$  in terms of Generalized Bi-Periodic Fibonacci and Lucas sequences when  $C = m^2 \pm 4$ .
